

# Geoworks 7

## Asset Management

The GeoWorks 7 Asset Management module may be used to record any number of asset types, together with their appropriate attributes.

Asset searches may be made by location, road section names or by asset type and attributes. Details can be displayed in either mapping or data only views; a number of background mapping options are available and asset type layers may be switched on or off in order to see specific items or groups of items only. A user view function enables custom searches to be created and saved by individual users.

### Mapping

Asset types may be displayed on the map as points, lines or areas. A 'Drag and Drop' facility enables the size, shape and positioning of assets on the map to be easily changed if required. If GPS enabled mobile devices are used, the accuracy of the position of an asset may be checked and altered while on site.

A full audit history is kept of any changes made; any previous changes are displayed in the History tab and may be undone if a change was made in error. User access settings allow for screen view options to be enabled/disabled and for editable or 'read-only' access.

# Geoworks 7

## Asset details

The range of attributes listed for each asset type is fully customisable, enabling details of contracts, properties, owners etc to be stored and updated either from the desktop or from a mobile device.

Details of any issues or faults logged against the asset, together with a cyclic operations or routine testing schedule and a full history of all outstanding and completed jobs.

## Additional documents

The Document Viewer option allows additional documents or photos (any format supported by the users operating system) to be held for each asset for later retrieval as required.

## Reports

A range of reports (both standard Geoworks and customer specific) are available. All report formats are Excel based, enabling users to modify these and/or incorporate them into other reports of their own.

*Maintaining a full up to date asset inventory, together with the ability to plan and execute large numbers of jobs quickly and effectively are essential requirements in managing major operations such as highways, housing, public lighting or parks and gardens.*

*The **Geoworks 7** Asset Management module enables both clients and maintenance contractors to manage these requirements with ease.*
